Test Case Management

Test Case Management is one of the core components of **Appvibe Test Management**. It allows you to create, organize, and track test cases efficiently, ensuring all your product requirements are fully tested.

What is a Test Case?

A test case is a set of conditions and steps used to validate a particular function or feature of your product. Each test case includes:

- A unique **Test Case ID** for easy identification.
- **Test Steps** detailing the actions a tester must perform.
- **Expected Results** that define what should happen when the test case is executed.
- **Actual Results** captured during execution to determine whether the test passed or failed.

Creating a Test Case in Appvibe:

1. **Navigate to Your Test Management Board** on monday.com.
2. **Click on the 'Add Test Case' button**, which will prompt you to fill in the following details:
   - **Test Case Name/ID**: A brief identifier for the test case.
   - **Description**: A detailed description of what this test case will cover.
   - **Preconditions**: Any setup required before executing the test (e.g., the user is logged in, the environment is pre-configured).
   - **Test Steps**: The detailed actions required to perform the test.
   - **Expected Results**: What should happen if the system is functioning correctly.
   - **Priority**: Set the priority level for this test case (e.g., High, Medium, Low).
3. **Save the Test Case** to store it in your test case library, where it can be executed as part of a test cycle.

Test Case Versions:

Appvibe allows you to manage **Test Case Versions**, ensuring that as your product evolves, your test cases are updated accordingly. Each version tracks changes made to the test case, allowing you to review past iterations if necessary.
